

STEP INSTALLATION

1. Place the step in the appropriate location on your pool installation.
The hardware package consists of the following components:
 - A. Six leveling columns (Starter Kit).
 - B. Stainless steel face plate screws.
 - C. 'Slippery When Wet' Sticker.
 2. Cut leveling support pipe to proper length as needed for your step.
 - A. Additional leveling columns must be cut and placed under step for each support socket. (2" schedule 40 PVC)
 3. Gently tap the leveling columns until they are fully seated in the sockets provided on the step support.
 4. Properly level the step horizontally and vertically. Check the step to make sure it is plumb with the flanking wall panels.
 5. To insure proper installation, clamp the step to the flanking wall panels. This will allow proper wall and drilling alignment.
 6. Pour a concrete bond beam at the base of the step at the same time the beam is poured around wall and brace system.
 7. Backfill the step cavity with granular material to achieve maximum compacting. Do not use clay, dirt, soil or other earthen materials for backfill. This material will not compact properly, leaving hollow cavities which will weaken step support over time.
- *NOTE: Warranty will be void if not backfilled properly.**
Leveling columns ARE NOT a substitute for proper backfilling.
Using only Leveling columns for support will void the warranty.
